MS Paint and MS Paintbrush You never know what kind of image a creative child may produce, and nothing creates an image quite like an original or a poorly drawn character. There are plenty of photo-editing programs, but kids love this handy application for manipulating an image on the fly. Just like any program, however, it's important that kids use the skills they develop in MS Paint wisely. Check out the following tips and points of interest in this simple and fun application: * The simplest way to make a selection is to trace around the image by going to Select→Free Select or by using the Rectangular or Elliptical Marquee tool. Then go to Edit→Select or Press Ctrl+A to select the whole image. Be aware that using the Select tool when the marquee is activated can be cumbersome — see the upcoming section "Selecting a rectangular or elliptical selection," for ideas on a more efficient way to do this. * The Paintbrush tool, when used carefully, is a great way to add detail and highlights. When using the Paintbrush tool, make sure that you select the appropriate brush tool in the Tool Palette. You have a selection of 15 different brush types, including Color, Gradient, Pattern, and Special, each with customizable settings such as size and opacity. When you use the Paintbrush tool, the Brush panel opens so you can see your settings. Don't forget that you can apply the Dodge or Burn tool to create highlights or shadows. * If you plan to colorize an image of a black-and-white illustration, you must use the Lasso tool to put the highlighting in areas that normally shouldn't be highlighted. * You can use the Eraser tool to remove unwanted areas of color or highlight. * The Blur tool is especially useful for retouching a photo. You can use it to reduce unwanted edges in an image or to soften the blur of a subject. The most important thing to remember is that MS Paintbrush is basically a photo-editing program, which your kids may come to appreciate as you show them the tricks.

The controversy surrounding the use of targeted therapies for the treatment of cancer continues to evolve and expand. One such example is the popularity of HER2-targeted therapies, which have been used to treat a number of different types of cancers, including breast, ovarian, gastric, bladder, and prostate. However, a key limitation of HER2-targeted agents is their activity in only a subset of patients with cancer harboring HER2 gene amplification or overexpression. For example, a substantial percentage of patients with HER2-positive gastric cancer do not respond to such therapy. So what can be done to circumvent the limitations of HER2-targeted therapy? Recent data from different laboratories have indicated that the development of drug resistance to HER2-targeted therapy can be reversed by second-line combination therapies involving various targeted agents. By promoting long-term responses to HER2-targeted therapies, this is a critical approach for improving patient survival. This viewpoint will explore the different approaches used to promote sustained responses to HER2-targeted therapy. It includes a description of the preclinical and clinical studies carried out and describes the approaches currently being investigated in clinical trials. Reversal of Tumor Resistance to Her2 Inhibitors ===== The development of resistance to HER2-targeted therapy in gastric cancer remains an obstacle that limits the effectiveness of this treatment. In this instance, it is suggested that the development of resistance to HER2-targeted therapy depends on changes in the expression of signaling pathways that regulate resistance. In this context, resistance can be reversed by concomitant administration of a second-line therapeutic agent that targets another molecule or pathway. Two main pathways have been associated with the development of resistance to HER2-targeted therapy: Epidermal growth factor receptor (EGFR) and epidermal growth factor receptor 2 (HER2), which are key oncogenes often overexpressed in gastric cancer. Supporting evidence for these ideas comes from preclinical studies in gastric cancer cell lines. The HER2 pathway: preclinical evidence ----- As mentioned above, gastric cancer is an aggressive disease that can metastasize and lead to the death of the patient. It is caused by the presence of genes that promote uncontrolled proliferation and to promote the formation of blood vessels for tumor growth and metastasis. Mutations or changes in the DNA of cells lead to the overexpression of proto-oncogenes or loss of
