SASUnit is a development tool that can be used for testing SAS programs. It is designed to assess the performance for SAS programs and can be used for testing and generating the documentation for multiple programs. The framework can execute and automatically generate the documentation for the tested items. It is developed by using SAS macros and shell commands. You can use SASUnit for testing performance issues in large programs with a collection of smaller unit tests. For a particular test, you can specify the command name, parameters, arguments, optional options, and of course the expected result. SASUnit can be deployed to a stand-alone local web server for public access. The tests can be run by a standalone web browser, the command line, SAS/IML, or through the SAS Webviewer. The results are presented in browser or can be exported to your file system to save and analyze. SASUnit also provides

the ability to quickly run unit tests from within SAS. Click on the "Help" button to the left of the button you want to use. For example, the help button on the command line is Help > Show the help menu and the help button next to the Command Line button. This button opens a menu of commands, keywords, and libraries for help: To the right of the button, the help text is displayed as a tooltip. This button is reserved for system use. To use this button, right-click the button to display the context menu. For more help, view the command, keyword, or library help. The SAS Unit Test menu contains the following items:

- Run Program: Starts the Unit Test. You can select a program from the list of available programs on the left.
- Run Command: Starts the command-line version of the Unit Test.
- Browse SASUnit: Displays the specifications of the Unit Test, including the test name and parameters.
- Run Files Opens a file selection dialog to allow you to specify which program you want to run. You can select any one

program to run on the list of programs to the left. Browse TestLog: Displays the test logs. You can select a file from the list on the right to view the results of the Unit Test. When you have finished a Unit Test, click "Create Log". The test log is a text file that you can use in subsequent tests. When you create a new test log, it is

What's New In?

From the very first version of SASUnit, it supports two commands: SASUnitExecute and SASUnitReport. They can generate the documentation for the outputs of the tested program and the SASUnitExeCommand parameter is used to specify which output to generate the documentation for. The SASUnitReport parameter is used to specify the folder and the name of the generated documentation file. SASUnit Report
Description: The documentation will be stored in a folder named

`$$SASUNIT_ROOT/Documentation` of the program folder that SASUnit executed. The naming convention for naming the file is as follows: `$$SASUNIT_ROOT/Documentation/ProgramName/Name_Component`. Then, the component name is passed as the text argument to the SASUnitReport macro and it will be printed into the file. The generated documentation file can also be generated on the fly, so the text argument can be any SAS variable name that you want. SASUnit Report Contents: 1. Standard SAS macros and their functions. 2. Some SAS macros for reading and writing the data. 3. SAS File and SAS Expression macros, which can be used to read data. 4. SAS Unit data. 5. SASUnit constants and their value. 6. Some SAS macros for getting the path and file name. 7. Some shell commands for executing SAS program. SAS Unit Execute Description: The documents can be generated for the two possible outputs of the tested SAS program. One of them can be named as expected and the other is named as

the unit data of SASUnit. SAS Unit Execute Contents: 1. Standard SAS macros and their functions. 2. SAS Macro for outputting data. 3. SASUnit constants and their value. 4. SAS Unit data. 5. Some SAS macros for getting the path and file name. In the following example, we execute a SAS program and get the data generated by this program and print them into the output. The program and data are then saved into two files, one of which is the expected document and the other is the unit data of SASUnit. Open the source code and output files in a text editor. 1. %SYSTEM-FULL-EXECUTE macro. Open the code in a text editor and add the following code to the end of the code. 2. %SYSTEM-FULL-EXECUTE
